

TRIUMPH-T APBI with SAVI®

Patient-Centered Care

Minimizing Patient Treatment Time

Three-fraction Treatment Protocol with SAVI allows effective APBI treatment to be completed in as little as 2 days¹

External Beam Radiation Therapy	SAVI 2-Day APBI
Patient receives 16-30 fractions*	Patient receives 3-5 fractions
The traditional approach for radiation therapy as part of BCT has been whole breast irradiation (WBI). A full course of WBI requires daily treatments and exposes the entire breast and surrounding critical structures to radiation.	The Strut Adjusted Volume Implant (SAVI) applicator delivers a form of accelerated partial breast radiation (APBI) known as breast brachytherapy, which delivers radiation from inside the breast. This allows physicians to precisely deliver treatment to the tumor cavity and surrounding tissue, and offers two key advantages: it spares healthy tissue from unnecessary radiation and reduces treatment time from 3-62 weeks to just 2-5 days. ¹

*A conservative estimate for number of fractions delivered in standard EBRT treatment protocol.
